

Lab 9: If-Else statement

1. Whether a storm is a tropical depression, tropical storm, or hurricane is determined by the average sustained wind speed. In miles per hour, a storm is a tropical depression if the winds are less than 38 mph. It is a tropical storm if the winds are between 39 and 73 mph, and it is a hurricane if the wind speeds are ≥ 74 mph. Write a script that will prompt the user for the wind speed of the storm, and will print which type of storm it is.
2. In aerodynamics, the Mach number is a critical quantity. It is defined as the ratio of the speed of an object (e.g., an aircraft) to the speed of sound. If the Mach number is less than 1, the flow is subsonic; if the Mach number is equal to 1, the flow is transonic; and if the Mach number is greater than 1, the flow is supersonic. Write a script that will prompt the user for the speed of an aircraft and the speed of sound at the aircraft's current altitude and will print whether the condition is subsonic, transonic, or supersonic.
3. In a script, the user is supposed to enter either a 'y' or 'n' in response to a prompt. The user's input is read into a character variable called "letter." The script will print "OK, continuing" if the user enters either a 'y' or 'Y' or it will print "OK, halting" if the user enters a 'n' or 'N' or "Error" if the user enters anything else. Put this statement in the script first:
letter = input ('Enter your answer: ', 's');
Write the script using a single nested **if-else** statement (**elseif** clause is permitted).
4. Write a function *flipvec* that will receive one input argument. If the input argument is a row vector, the function will reverse the order and return a new row vector. If the input argument is a column vector, the function will reverse the order and return a new column vector. If the input argument is a matrix or a scalar, the function will return the input argument unchanged.
5. Write a function *eqfn* that will calculate $f(x) = x^2 + 1/x$ for all elements of x . Since x division by 0 is not possible, if any element in x is zero, the function will instead return a flag of -99.

for-end loop

6. In the Command Window, write **for** loop that will iterate through the integers from 32 to 255. For each, show the corresponding character from the character encoding. Play with this! Try printing characters beyond the standard ASCII, in small groups. For example, print the characters that correspond to integers from 300 to 340.
7. Write a function *sumsteps2* that calculates and returns the sum of 1 to n in steps of 2, where n is an argument passed to the function. For example, if 11 is passed, it will return $1 + 3 + 5 + 7 + 9 + 11$. Do this using **for** loop. Calling the function will look like this:

```
>> sumsteps2 (11)  
ans=36
```
8. Write a script that will load data from a file into a matrix. Create the data file first, and make sure that there is the same number of values on every line in the file so that it can be loaded into a matrix. Using **for** loop, it will then create a subplot for every row in the matrix, and will plot the numbers from each row element in the Figure Window.

9. Write a script that will print the following multiplication table:

```
1
2 4
3 6 9
4 8 12 16
5 10 15 20 25
```

10. A machine cuts N pieces of a pipe. After each cut, each piece of pipe is weighed and its length is measured; these 2 values are then stored in a file called *pipe.dat* [first the weight and then the length on each line of the file]. Ignoring units, the weight is supposed to be between 2.1 and 2.3, inclusive, and the length is supposed to be between 10.3 and 10.4, inclusive. The following is just the beginning of what will be a long script to work with these data. For now, the script will just count how many rejects there are. A reject is any piece of pipe that has an invalid weight and/or length. For a simple example, if N is 3 [meaning three lines in the file] and the file stores:

```
2.14 10.30
2.32 10.36
2.20 10.35
```

There is only one reject, the second one, as it weighs too much. The script would print:
There were 1 rejects.
